APPROVED JURISDICTIONAL DETERMINATION FORM **U.S. Army Corps of Engineers**

This form should be completed by following the instructions provided in Section IV of the JD Form Instructional Guidebook.

SECTION I: BACKGROUND INFORMATION

A. REPORT COMPLETION DATE FOR APPROVED JURISDICTIONAL DETERMINATION (JD): September 10, 2015

B. DISTRICT OFFICE, FILE NAME, AND NUMBER: CENAB-OP-RMS (WO DPW/Berlin Sanitary Landfill) 2015-61024

PROJECT LOCATION AND BACKGROUND INFORMATION: A 45-acre portion of a property known as the Berlin Sanitary Landfill located at 9696 Millhaven Road in Berlin, Worcester County, Maryland

Cente Name Name Creek Name \(\textit{\textit{\textit{\textit{Name}}}}\)	Maryland County/parish/borough: Worcester City: Berlin r coordinates of site (lat/long in degree decimal format): Lat. 38° 20' 01", Long75° 11' 30". of nearest waterbody: Kitts Branch of nearest Traditional Navigable Water (TNW) into which the aquatic resource flows: N/A (Closest TNW is Ayers) of watershed or Hydrologic Unit Code (HUC): Chincoteague 02040303 check if map/diagram of review area and/or potential jurisdictional areas is/are available upon request. Scheck if other sites (e.g., offsite mitigation sites, disposal sites, etc) are associated with this action and are recorded in a different JD form.
	EW PERFORMED FOR SITE EVALUATION (CHECK ALL THAT APPLY): office (Desk) Determination. Date: 18 August 2015 ield Determination. Date(s): 20 November 2014
SECTION	II: SUMMARY OF FINDINGS ECTION 10 DETERMINATION OF JURISDICTION.
A. KIIA S	ECHON TO DETERMINATION OF SURISDICTION.
in the revie	not "navigable waters of the U.S." within Rivers and Harbors Act (RHA) jurisdiction (as defined by 33 CFR part 329) we area. [Required] Vaters subject to the ebb and flow of the tide. Vaters are presently used, or have been used in the past, or may be susceptible for use to transport interstate or preign commerce. Explain:
B. CWAS	SECTION 404 DETERMINATION OF JURISDICTION.
There are [Required]	not "waters of the U.S." within Clean Water Act (CWA) jurisdiction (as defined by 33 CFR part 328) in the review area
	Indicate presence of waters of U.S. in review area (check all that apply): TNWs, including territorial seas Wetlands adjacent to TNWs Relatively permanent waters ² (RPWs) that flow directly or indirectly into TNWs Non-RPWs that flow directly or indirectly into TNWs Wetlands directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to but not directly abutting RPWs that flow directly or indirectly into TNWs Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs Impoundments of jurisdictional waters
	Impoundments of jurisdictional waters Isolated (interstate or intrastate) waters, including isolated wetlands
b.	Identify (estimate) size of waters of the U.S. in the review area: There are no waters of the U.S. within the review area.

Wetlands:

c. Limits (boundaries) of jurisdiction based on: 1987 U.S. Army Corps of Engineers Wetlands Delineation Manual

¹ Boxes checked below shall be supported by completing the appropriate sections in Section III below.

² For purposes of this form, an RPW is defined as a tributary that is not a TNW and that typically flows year-round or has continuous flow at least "seasonally" (e.g., typically 3 months).

Elevation of established OHWM (if known): The OHWM is highly variable, and thus is unknown.

2. Non-regulated waters/wetlands (check if applicable):³

Potentially jurisdictional waters and/or wetlands were assessed within the review area and determined not to be jurisdictional. Explain: During the 20 November 2014 Corps site visit, the circumference of the isolated wetlands A through D were walked and no culvert or other drainage was visible connecting these five wetlands with tributaries. No other tributaries or wetlands. The wetlands were entirely within depressional areas. Wetland E was observed to be surrounded by a berm to the east and no flow paths were observed along the edge of the wetlands on any side. Wetlands B and D were observed within depressional areas along an existing maintenance road with berms on either side and no sign of connection to existing streams off-site. Wetland C was entirely surrounded by uplands with no visible drainage path or culvert pipe connecting the wetland to waters of the U.S. Wetland A was observed to be within a depression between two upland areas and was observed to have no connectors to streams. Although the berms do not entirely surround any wetlands, the areas next to the isolated wetlands are upland and there are no culverts connecting the wetland with any waters of the United States at this location or any other field evidence of connection to a stream; therefore, based on US vs. James Wilson 4th circuit case/CFR 328.3 (a)(3), the Baltimore District does not regulate the following isolated wetlands.

Feature	Туре	Size (acres)
Wetland A	Scrub-shrub wetland	0.26
Wetland B	Emergent Wetland	0.26
Wetland C	Emergent Wetland	0.06
Wetland D	Emergent Wetland	0.22
Wetland E	Emergent Wetland	1.31

SECTION III: CWA ANALYSIS

A. TNWs AND WETLANDS ADJACENT TO TNWs

The agencies will assert jurisdiction over TNWs and wetlands adjacent to TNWs. If the aquatic resource is a TNW, complete Section III.A.1 and Section III.D.1. only; if the aquatic resource is a wetland adjacent to a TNW, complete Sections III.A.1 and 2 and Section III.D.1.; otherwise, see Section III.B below.

1. TNW

Identify TNW:

Summarize rationale supporting determination:

2. Wetland adjacent to TNW

Summarize rationale supporting conclusion that wetland is "adjacent":

B. CHARACTERISTICS OF TRIBUTARY (THAT IS NOT A TNW) AND ITS ADJACENT WETLANDS (IF ANY):

This section summarizes information regarding characteristics of the tributary and its adjacent wetlands, if any, and it helps determine whether or not the standards for jurisdiction established under *Rapanos* have been met.

The agencies will assert jurisdiction over non-navigable tributaries of TNWs where the tributaries are "relatively permanent waters" (RPWs), i.e. tributaries that typically flow year-round or have continuous flow at least seasonally (e.g., typically 3 months). A wetland that directly abuts an RPW is also jurisdictional. If the aquatic resource is not a TNW, but has year-round (perennial) flow, skip to Section III.D.2. If the aquatic resource is a wetland directly abutting a tributary with perennial flow, skip to Section III.D.4.

A wetland that is adjacent to but that does not directly abut an RPW requires a significant nexus evaluation. Corps districts and EPA regions will include in the record any available information that documents the existence of a significant nexus between a relatively permanent tributary that is not perennial (and its adjacent wetlands if any) and a traditional navigable water, even though a significant nexus finding is not required as a matter of law.

If the waterbody⁴ is not an RPW, or a wetland directly abutting an RPW, a JD will require additional data to determine if the waterbody has a significant nexus with a TNW. If the tributary has adjacent wetlands, the significant nexus evaluation must consider the tributary in combination with all of its adjacent wetlands. This significant nexus evaluation that combines, for analytical purposes, the tributary and all of its adjacent wetlands is used whether the review area identified in the JD request is the tributary, or its adjacent wetlands, or both. If the JD

³ Supporting documentation is presented in Section III.F.

⁴ Note that the Instructional Guidebook contains additional information regarding swales, ditches, washes, and erosional features generally and in the arid West.

covers a tributary with adjacent wetlands, complete Section III.B.1 for the tributary, Section III.B.2 for any onsite wetlands, and Section III.B.3 for all wetlands adjacent to that tributary, both onsite and offsite. The determination whether a significant nexus exists is determined in Section III.C below.

1. Characteristics of non-TNWs that flow directly or indirectly into TNW

	(i)	Wa Dra Ave	neral Area Conditions: Itershed size: Inage area: Irage annual rainfall: Irage annual snowfall:
	(ii)		rsical Characteristics: Relationship with TNW: ☐ Tributary flows directly into TNW. ☐ Tributary flows through Pick List tributaries before entering TNW.
			Project waters are river miles from TNW. Project waters are river miles from RPW. Project waters are aerial (straight) miles from TNW. Project waters are aerial (straight) miles from RPW. Project waters cross or serve as state boundaries. Explain: Identify flow route to TNW ⁵ : Tributary stream order, if known:
(b)		<u>Ger</u>	neral Tributary Characteristics (check all that apply): Tributary is: Natural Artificial (man-made). Explain: Manipulated (man-altered). Explain:
			Tributary properties with respect to top of bank (estimate): Average width: Average depth: Average side slopes:
			Primary tributary substrate composition (check all that apply): Silts Sands Concrete Gravel Muck Bedrock Vegetation. Type/% cover: Other. Explain:
			Tributary condition/stability [e.g., highly eroding, sloughing banks]. Explain: Tributary geometry: Tributary gradient (approximate average slope):
		(c)	Flow: Tributary provides for:
			Estimate average number of flow events in review area/year:
			Describe flow regime:
			Other information on duration and volume:
			Surface flow is: Characteristics:
			Subsurface flow:
			☐ Dye (or other) test performed: N/A.
			Tributary has (check all that apply): ☐ Bed and banks

⁵ Flow route can be described by identifying, e.g., tributary a, which flows through the review area, to flow into tributary b, which then flows into TNW.

		 □ OHWM⁶ (check all indicators that apply): □ clear, natural line impressed on the bank □ changes in the character of soil □ destruction of terrestrial vegetation □ shelving □ vegetation matted down, bent, or absent □ leaf litter disturbed or washed away □ sediment deposition □ water staining □ other (list): □ Discontinuous OHWM.⁷ Explain: N/A. 	
		If factors other than the OHWM were used to determine lateral extent of CWA jurisdiction (check all that	
apply):		High Tide Line indicated by: oil or scum line along shore objects survey to available datum; fine shell or debris deposits (foreshore) physical markings; physical markings/characteristics vegetation lines/changes in vegetation types. tidal gauges other (list):	
	(iii)	Chemical Characteristics:	
		Characterize tributary (e.g., water color is clear, discolored, oily film; water quality; general watershed characteristics, etc.). Explain: Identify specific pollutants, if known:	
		Biological Characteristics. Channel supports (check all that apply): Riparian corridor. Characteristics (type, average width): Wetland fringe. Characteristics: Habitat for: Federally Listed species. Explain findings: Fish/spawn areas. Explain findings: Other environmentally-sensitive species. Explain findings: Aquatic/wildlife diversity. Explain findings:	
2.	Cha	aracteristics of wetlands adjacent to non-TNW that flow directly or indirectly into TNW	
	(i) Physical Characteristics:		
		(a) General Wetland Characteristics: Properties: Wetland size: Wetland type. Wetland quality. Explain: Refer to Section IV.B. Project wetlands cross or serve as state boundaries. Explain: N/A.	
		(b) General Flow Relationship with Non-TNW: Flow is: Explain:	
		Surface flow is: Characteristics:	
		Subsurface flow: Explain findings: Dye (or other) test performed:	
		(c) Wetland Adjacency Determination with Non-TNW: □ Directly abutting □ Not directly abutting □ Discrete wetland hydrologic connection. Explain: □ Ecological connection. Explain: □ Separated by berm/barrier. Explain:	
		(d) Proximity (Relationship) to TNW Project wetlands are river miles from TNW.	

⁶A natural or man-made discontinuity in the OHWM does not necessarily sever jurisdiction (e.g., where the stream temporarily flows underground, or where the OHWM has been removed by development or agricultural practices). Where there is a break in the OHWM that is unrelated to the waterbody's flow regime (e.g., flow over a rock outcrop or through a culvert), the agencies will look for indicators of flow above and below the break ⁷Ibid.

	Project waters are aerial (straight) miles from TNW. Flow is from:
	Estimate approximate location of wetland as within the floodplain.
	(ii) Chemical Characteristics:
	Characterize wetland system (e.g., water color is clear, brown, oil film on surface; water quality; general watershed characteristics; etc.). Explain:
	Identify specific pollutants, if known:
	(iii) Biological Characteristics. Wetland supports (check all that apply):
	 □ Riparian buffer. Characteristics (type, average width): □ Vegetation type/percent cover. Explain: □ Habitat for: □ Federally Listed species. Explain findings: □ Fish/spawn areas. Explain findings: □ Other environmentally-sensitive species. Explain findings: □ Aquatic/wildlife diversity. Explain findings:
3.	Characteristics of all wetlands adjacent to the tributary (if any) All wetland(s) being considered in the cumulative analysis: Approximately acres in total are being considered in the cumulative analysis.
	For each wetland, specify the following:
	Directly abuts? (Y/N) Size (in acres) Directly abuts? (Y/N) Size (in acres)

Summarize overall biological, chemical and physical functions being performed: Refer to Section IV.B.

C. SIGNIFICANT NEXUS DETERMINATION

A significant nexus analysis will assess the flow characteristics and functions of the tributary itself and the functions performed by any wetlands adjacent to the tributary to determine if they significantly affect the chemical, physical, and biological integrity of a TNW. For each of the following situations, a significant nexus exists if the tributary, in combination with all of its adjacent wetlands, has more than a speculative or insubstantial effect on the chemical, physical and/or biological integrity of a TNW. Considerations when evaluating significant nexus include, but are not limited to the volume, duration, and frequency of the flow of water in the tributary and its proximity to a TNW, and the functions performed by the tributary and all its adjacent wetlands. It is not appropriate to determine significant nexus based solely on any specific threshold of distance (e.g. between a tributary and its adjacent wetland or between a tributary and the TNW). Similarly, the fact an adjacent wetland lies within or outside of a floodplain is not solely determinative of significant nexus.

Draw connections between the features documented and the effects on the TNW, as identified in the *Rapanos* Guidance and discussed in the Instructional Guidebook. Factors to consider include, for example:

- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to carry pollutants or flood waters to TNWs, or to reduce the amount of pollutants or flood waters reaching a TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), provide habitat and lifecycle support functions for fish and other species, such as feeding, nesting, spawning, or rearing young for species that are present in the TNW?
- Does the tributary, in combination with its adjacent wetlands (if any), have the capacity to transfer nutrients and organic carbon that support downstream foodwebs?
- Does the tributary, in combination with its adjacent wetlands (if any), have other relationships to the physical, chemical, or biological integrity of the TNW?

Note: the above list of considerations is not inclusive and other functions observed or known to occur should be documented below:

- Significant nexus findings for non-RPW that has no adjacent wetlands and flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary itself, then go to Section III.D:
- 2. Significant nexus findings for non-RPW and its adjacent wetlands, where the non-RPW flows directly or indirectly into TNWs. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

3. Significant nexus findings for wetlands adjacent to an RPW but that do not directly abut the RPW. Explain findings of presence or absence of significant nexus below, based on the tributary in combination with all of its adjacent wetlands, then go to Section III.D:

D. DETERMINATIONS OF JURISDICTIONAL FINDINGS. THE SUBJECT WATERS/WETLANDS ARE (CHECK ALL THAT APPLY):

1.	TNWs and Adjacent Wetlands. Check all that apply and provide size estimates in review area: TNWs: Wetlands adjacent to TNWs:
2.	 RPWs that flow directly or indirectly into TNWs. Tributaries of TNWs where tributaries typically flow year-round are jurisdictional. Provide data and rationale indicating that tributary is perennial: Tributaries of TNW where tributaries have continuous flow "seasonally" (e.g., typically three months each year) are jurisdictional. Data supporting this conclusion is provided at Section III.B. Provide rationale indicating that tributary flows seasonally:
	Provide estimates for jurisdictional waters in the review area (check all that apply): Tributary waters: Other non-wetland waters: acres. Identify type(s) of waters:
3.	Non-RPWs ⁸ that flow directly or indirectly into TNWs. Waterbody that is not a TNW or an RPW, but flows directly or indirectly into a TNW, and it has a significant nexus with a TNW is jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional waters within the review area (check all that apply): Tributary waters: Other non-wetland waters: Identify type(s) of waters:
4.	Wetlands directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands directly abut RPW and thus are jurisdictional as adjacent wetlands. Wetlands directly abutting an RPW where tributaries typically flow year-round. Provide data and rationale indicating that tributary is perennial in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW:
	Wetlands directly abutting an RPW where tributaries typically flow "seasonally." Provide data indicating that tributary is seasonal in Section III.B and rationale in Section III.D.2, above. Provide rationale indicating that wetland is directly abutting an RPW: Provide acreage estimates for jurisdictional wetlands in the review area:
5.	Wetlands adjacent to but not directly abutting an RPW that flow directly or indirectly into TNWs. Wetlands that do not directly abut an RPW, but when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisidictional. Data supporting this conclusion is provided at Section III.C.
	Provide acreage estimates for jurisdictional wetlands in the review area:
6.	Wetlands adjacent to non-RPWs that flow directly or indirectly into TNWs. Wetlands adjacent to such waters, and have when considered in combination with the tributary to which they are adjacent and with similarly situated adjacent wetlands, have a significant nexus with a TNW are jurisdictional. Data supporting this conclusion is provided at Section III.C.
	Provide estimates for jurisdictional wetlands in the review area:
7.	Impoundments of jurisdictional waters. As a general rule, the impoundment of a jurisdictional tributary remains jurisdictional. Demonstrate that impoundment was created from "waters of the U.S.," or Demonstrate that water meets the criteria for one of the categories presented above (1-6), or Demonstrate that water is isolated with a nexus to commerce (see E below).

⁸See Footnote # 3.

⁹ To complete the analysis refer to the key in Section III.D.6 of the Instructional Guidebook.
